- **Self-Assessment:** Allows learners to identify knowledge gaps and focus on areas needing improvement. By systematically studying questions and answers, learners can build confidence and competence in biostatistics.

**Core Topics Covered in a Biostatistics Questions Bank**

A comprehensive questions bank encompasses various essential topics in biostatistics. These include:

- **Basic Concepts** - Definitions of statistical terms - Types of data - Measures of central tendency and variability
- **Probability and Distributions** - Basic probability principles - Probability distributions (Normal, Binomial, Poisson, etc.) - Central Limit Theorem
- **Sampling and Sampling Distributions** - Sampling methods - Sampling distribution of the mean and proportion
- **Inferential Statistics** - Hypothesis testing - Confidence intervals - p-values

and significance levels Comparative Tests - t-tests (independent and paired)  
- Chi-square test - ANOVA Correlation and Regression - Pearson and  
Spearman correlation coefficients - Simple and multiple linear regression  
Advanced Topics - Survival analysis - Logistic regression - Non-parametric  
tests Sample Biostatistics Questions with Answers Basic Knowledge  
Questions Q1: What is the difference between descriptive and inferential  
statistics? Answer: Descriptive statistics summarize and describe the main  
features of a dataset, such as measures of central tendency (mean,  
median, mode) and variability (range, variance, standard deviation).  
Inferential statistics, on the other hand, use sample data to make  
generalizations or predictions about a larger population, often through  
hypothesis testing and confidence intervals. Q2: Define the term 'p-value' in  
hypothesis testing. Answer: A p-value is the probability of obtaining an  
observed result, or one more extreme, assuming that the null hypothesis is  
true. It helps determine the statistical significance of the findings; a smaller  
p-value indicates stronger evidence against the null hypothesis. Probability  
and Distributions Q3: What is the Central Limit Theorem? Answer: The  
Central Limit Theorem states that, given a sufficiently large sample size,  
the sampling distribution of the sample mean will be approximately  
normally distributed, regardless of the shape of the population distribution.  
This principle underpins many inferential statistical methods. Q4: Which  
distribution is most appropriate for modeling the number of events  
happening in a fixed interval of time? Answer: The Poisson distribution is  
most appropriate for modeling the number of events occurring in a fixed  
interval, especially when events occur independently and at a constant  
average rate. Hypothesis Testing and Confidence Intervals Q5: When is it  
appropriate to use a paired t-test? Answer: A paired t-test is used when  
comparing two related samples or measurements taken from the same  
subjects under different conditions, such as before-and-after studies or  
matched pairs. Q6: How is a 95% confidence interval interpreted? Answer:  
A 95% confidence interval provides a range within which we are 95%  
confident that the true population parameter (such as the mean) lies, based  
on the sample data. Comparative and Correlation Analysis Q7: What is the

main difference between correlation and causation? Answer: Correlation indicates a statistical association between two variables, but it does not imply that one causes the other. Causation implies a cause-and-effect relationship, which requires further evidence beyond correlation. Q8: Which test would you use to compare proportions between two independent groups? Answer: The Chi-square test of independence or Fisher's exact test (for small sample sizes) is used to compare proportions between two independent groups. Regression and Advanced Methods Q9: What does the coefficient of determination (R-squared) indicate in regression analysis? Answer: R-squared indicates the proportion of variability in the dependent variable that can be explained by the independent variable(s) in the regression model. Values range from 0 to 1, with higher values indicating better model fit. Q10: In logistic regression, what is the primary outcome variable? Answer: The primary outcome variable in logistic regression is binary (dichotomous), such as presence or absence of disease, success or failure.
